Bash Scripts Basics

Basic output commands

- So, In this I have already created a file using '**mkdir Sri.bash**'
- In that am executing all these bash scripts.
- After creating a file, I used '**nano**' editor to make some contents inside it.
- In accordance to that I have changed the permission of the file using '**chmod 755 Sri.bash'**
- To make execution enable.
- After that I executed the bash scripting file using '**./**'

Defining the Sanity Tasks.

root@ip-172-31-25-65:~

```
  GNU nano 8.3
#!/bin/bash
#Simple output Bash script
#Purpose 'Learning'
#Srinivasan
#15/10/2026
echo
whoami
echo
pwd
echo
hostname
echo
ls -ltr
echo
```

- So in this we'll be trying up with some sanity task performances of the processor.
- Same all the basic make up has been made like creation of file, permission to the file.
- Therefore the results are as shown in the below picture.

root@ip-172-31-25-65:~

```
[root@ip-172-31-25-65 ~]# ./Sri.bashh
-bash: ./Sri.bashh: No such file or directory
[root@ip-172-31-25-65 ~]# ./Sri.bash

root

/root

ip-172-31-25-65.ec2.internal

total 4
drwxr-xr-x. 3 root root  20 Oct 15 12:12 sri
-rwxr-xr-x. 1 root root 137 Oct 16 06:15 Sri.bash

[root@ip-172-31-25-65 ~]# cat Sri.bash
#!/bin/bash
#Simple output Bash script
#Purpose 'Learning'
#Srinivasan
#15/10/2026
echo
whoami
echo
pwd
echo
hostname
echo
ls -ltr
echo

[root@ip-172-31-25-65 ~]#
```

Defining Variable Form.

root@ip-172-31-25-65:~

```
  GNU nano 8.3
#!/bin/bash
#Simple output Bash script
#Purpose 'Learning'
#Srinivasan
#15/10/2026
echo
a=Srini
b=Thotabella
c='Devops'

echo "My first name is $a"
echo "My surname is $b"
echo 'What am learning is $c'
echo
```

- Basically, defining variables is nothing but giving the variables a constants.
- So, whenever we are using those variables the constants will be executed. Once in the execution time.
- For that the 'echo $_' that is important.
- In this I have provided the variables 'a' 'b' 'c' with some datas.
- Once in my commands ill use the variables. Instead of being straight.

root@ip-172-31-25-65:~

```
[root@ip-172-31-25-65 ~]# ./Sri.bash

My first name is Srini
My surname is Thotabella
'What am learning is 'Devops''

[root@ip-172-31-25-65 ~]#
```

Reading the Inputs

root@ip-172-31-25-65:~

```
  GNU nano 8.3
#!/bin/bash
#Simple output Bash script
#Purpose 'Learning'
#Srinivasan
#15/10/2026
echo
echo "What is your first name?"
read a
echo

echo "What is your last name?"
read b
echo

echo Hello $a $b
```

- So, in this we'll be doing the read inputs, which is nothing but the user will type in the inputs after execution.
- That will be considered by the bash and other outputs which is related to this input will be displayed.

root@ip-172-31-25-65:~

```
[root@ip-172-31-25-65 ~]# ./Sri.bash

What is your first name?
Srinivasan

What is your last name?
Thotabella

Hello Srinivasan Thotabella
[root@ip-172-31-25-65 ~]#
```

Scripts which run with commands within

root@ip-172-31-25-65:~

```
  GNU nano 8.3
#!/bin/bash
#Simple output Bash script
#Purpose 'Learning'
#Srinivasan
#15/10/2026
echo
echo
echo "Hello World `whoami`"
echo
echo "Actually today is `date`"
echo
echo "Number of user login: `who | wc -l `"
echo
echo 'END'
```

- This is nothing but defining a command within a line of usage.
- Therefore the questions asked will be with commands which is answer of the question.

root@ip-172-31-25-65:~

```
[root@ip-172-31-25-65 ~]# ./Sri.bash

Hello World root

Actually today is Fri Oct 16 06:37:51 UTC 2026

Number of user login: 4

END

[root@ip-172-31-25-65 ~]#
```

Read the inputs and perform the task

root@ip-172-31-25-65:~

```
  GNU nano 8.3
#!/bin/bash
#Simple output Bash script
#Purpose 'Learning'
#Srinivasan
#15/10/2026
echo
echo
echo Enter the oldfile name to be renamed
read oldfilename

echo Enter the new file name to be renamed as
read newfilename

mv $oldfilename $newfilename
echo The file has been renamed as $newfilename
echo
echo 'END'
echo
echo
```

So, in this the task is based upon the read input.

So the input will be considered by the bash and the tasks are performed.

root@ip-172-31-25-65:~

```
[root@ip-172-31-25-65 ~]# ./Sri.bash

Enter the oldfile name to be renamed
Sri.bash
Enter the new file name to be renamed as
Semple
The file has been renamed as Semple

END

[root@ip-172-31-25-65 ~]# cat Semple
#!/bin/bash
#Simple output Bash script
#Purpose 'Learning'
#Srinivasan
#15/10/2026
echo
echo
echo Enter the oldfile name to be renamed
read oldfilename

echo Enter the new file name to be renamed as
read newfilename

mv $oldfilename $newfilename
echo The file has been renamed as $newfilename
echo
echo 'END'
echo
echo
```

Some of my Understandings with Scripts.

root@ip-172-31-25-65:~/sri/script

```
  GNU nano 8.3                                                                  Semple
#!/bin/bash
#Purpose Testing Script Format
#Date 09/9/2026
a=Srini
echo ------------------------------------------------------------------------------------------------------------
echo Who are you
echo
echo $a
echo ------------------------------------------------------------------------------------------------------------
echo what is the time
echo
time
echo ------------------------------------------------------------------------------------------------------------
echo which month is this
echo
